```
1 To the People of the State of New York:
2
3 AMONG the numerous advantages promised by a
  wellconstructed Union, none deserves to be more
  accurately developed than its tendency to break
  and control the violence of faction. The friend
  of popular governments never finds himself so
  much alarmed for their character and fate, as
  when he contemplates their propensity to this
  dangerous vice. He will not fail, therefore, to
  set a due value on any plan which, without
  violating the principles to which he is attached,
  provides a proper cure for it. The instability,
  injustice, and confusion introduced into the
  public councils, have, in truth, been the mortal
  diseases under which popular governments have
  everywhere perished; as they continue to be the
  favorite and fruitful topics from which the
  adversaries to liberty derive their most specious
  declamations. The valuable improvements made by
  the American constitutions on the popular models,
  both ancient and modern, cannot certainly be too
  much admired; but it would be an unwarrantable
  partiality, to contend that they have as
  effectually obviated the danger on this side, as
  was wished and expected. Complaints are
  everywhere heard from our most considerate and
  virtuous citizens, equally the friends of public
  and private faith, and of public and personal
  liberty, that our governments are too unstable,
  that the public good is disregarded in the
  conflicts of rival parties, and that measures are
  too often decided, not according to the rules of
  justice and the rights of the minor party, but by
  the superior force of an interested and
  overbearing majority. However anxiously we may
  wish that these complaints had no foundation, the
  evidence, of known facts will not permit us to
  deny that they are in some degree true. It will
  be found, indeed, on a candid review of our
  situation, that some of the distresses under
  which we labor have been erroneously charged on
  the operation of our governments; but it will be
  found, at the same time, that other causes will
  not alone account for many of our heaviest
  misfortunes; and, particularly, for that
  prevailing and increasing distrust of public
```

1 The Utility of the Union in Respect to Commercial
  Relations and a Navy
2 Hamilton for the Independent Journal.
3
4 To the People of the State of New York:
5 THE importance of the Union, in a commercial
  light, is one of those points about which there
  is least room to entertain a difference of
  opinion, and which has, in fact, commanded the
  most general assent of men who have any
  acquaintance with the subject. This applies as
  well to our intercourse with foreign countries as
  with each other.
6
7 There are appearances to authorize a supposition
  that the adventurous spirit, which distinguishes
  the commercial character of America, has already
  excited uneasy sensations in several of the
  maritime powers of Europe. They seem to be
  apprehensive of our too great interference in
  that carrying trade, which is the support of
  their navigation and the foundation of their
  naval strength. Those of them which have colonies
  in America look forward to what this country is
  capable of becoming, with painful solicitude.
  They foresee the dangers that may threaten their
  American dominions from the neighborhood of
  States, which have all the dispositions, and
  would possess all the means, requisite to the
  creation of a powerful marine. Impressions of
  this kind will naturally indicate the policy of
  fostering divisions among us, and of depriving
  us, as far as possible, of an active commerce in
  our own bottoms. This would answer the threefold
  purpose of preventing our interference in their
  navigation, of monopolizing the profits of our
  trade, and of clipping the wings by which we
  might soar to a dangerous greatness. Did not
  prudence forbid the detail, it would not be
  difficult to trace, by facts, the workings of
  this policy to the cabinets of ministers.
8
9 If we continue united, we may counteract a policy
  so unfriendly to our prosperity in a variety of
  ways. By prohibitory regulations, extending, at
  the same time, throughout the States, we may
  oblige foreign countries to bid against each
```

unknown.txt

```
1 To the People of the State of New York:
2 I SHALL here, perhaps, be reminded of a current
  observation, ``that where annual elections end,
  tyranny begins.`` If it be true, as has often
  been remarked, that sayings which become
  proverbial are generally founded in reason, it is
  not less true, that when once established, they
  are often applied to cases to which the reason of
  them does not extend. I need not look for a proof
  beyond the case before us. What is the reason on
  which this proverbial observation is founded? No
  man will subject himself to the ridicule of
  pretending that any natural connection subsists
  between the sun or the seasons, and the period
  within which human virtue can bear the temptations
  of power. Happily for mankind, liberty is not, in
  this respect, confined to any single point of
  time; but lies within extremes, which afford
  sufficient latitude for all the variations which
  may be required by the various situations and
  circumstances of civil society. The election of
  magistrates might be, if it were found expedient,
  as in some instances it actually has been, daily,
  weekly, or monthly, as well as annual; and if
  circumstances may require a deviation from the
  rule on one side, why not also on the other side?
  Turning our attention to the periods established
  among ourselves, for the election of the most
  numerous branches of the State legislatures, we
  find them by no means coinciding any more in this
  instance, than in the elections of other civil
  magistrates. In Connecticut and Rhode Island, the
  periods are half-yearly. In the other States,
  South Carolina excepted, they are annual. In South
  Carolina they are biennial as is proposed in the
  federal government. Here is a difference, as four
  to one, between the longest and shortest periods;
  and yet it would be not easy to show, that
  Connecticut or Rhode Island is better governed, or
  enjoys a greater share of rational liberty, than
  South Carolina; or that either the one or the
  other of these States is distinguished in these
  respects, and by these causes, from the States
  whose elections are different from both. In
  searching for the grounds of this doctrine, I can
  discover but one, and that is wholly inapplicable
  to our case. The important distinction so well
```

First, some review

Recall the good times

Permutations

$n!$

How many ways are
there to order n
objects?

Fixed Sized Buckets

How many ways are there to put n distinct objects into r buckets such that:

n_1 go into bucket 1

n_2 go into bucket 2

...

n_r go into bucket r ?

Fixed Sized Buckets

How many ways are there to put n distinct objects into r buckets such that:

n_1 go into bucket 1

n_2 go into bucket 2

...

n_r go into bucket r ?

Ways to put elements into fixed size containers

How many ways are there to put n distinct objects into r buckets such that:

n_1 go into bucket 1

n_2 go into bucket 2

...

n_r go into bucket r ?

This is called the
multinomial notation

$$\frac{n!}{n_1!n_2!\dots n_r!} = \binom{n}{n_1, n_2, \dots, n_r}$$

Note: Multinomial > Binomial

Counting unordered objects

Binomial coefficient

How many ways are there
to order n heads
and $(n-k)$ tails

$$\binom{n}{k} = \frac{n!}{k! (n - k)!}$$

Called the binomial coefficient
because of something from Algebra

Multinomial coefficient

How many ways are there
to order n_1 outcomes of type 1
 n_2 outcomes of type 2
 n_3 outcomes of type 3...
 n_r outcomes of type r

$$\binom{n}{n_1, n_2, \dots, n_r} = \frac{n!}{n_1! n_2! \cdots n_r!}$$

Multinomials generalize
Binomials for counting.

How do you represent a joint distribution?

Roll two 6-sided dice, yielding values X and Y .

What is the joint PMF of X and Y ?

$$P(X = a, Y = b) = 1/36 \quad (a, b) \in \{(1,1), \dots, (6,6)\}$$

		X					
		1	2	3	4	5	6
Y	1	1/36	1/36
	2
	3
	4
	5
	6	1/36	1/36

$P(X = 4, Y = 3)$

Probability table

- All possible outcomes for several discrete RVs
- Not parametric (e.g., parameter p in $\text{Ber}(p)$)

How do you represent a joint distribution?

Joint

	Roommates	2RoomDbI	Shared Partner	Single	
Frosh	0.30	0.07	0.00	0.00	0.37
Soph	0.12	0.18	0.00	0.03	0.32
Junior	0.04	0.01	0.00	0.10	0.15
Senior	0.01	0.02	0.02	0.01	0.05
5+	0.02	0.00	0.05	0.04	0.11
	0.49	0.27	0.07	0.18	1.00

Marginals

Key limitation of the joint table:
it is too big

What about 3 Random Variables?

D is disease, ***S*** is can smell, ***F*** is fever status

$D = 0$

	$S = 0$	$S = 1$
$F = \text{none}$	0.024	0.783
$F = \text{low}$	0.003	0.092
$F = \text{high}$	0.001	0.046

$D = 1$

	$S = 0$	$S = 1$
$F = \text{none}$	0.006	0.014
$F = \text{low}$	0.005	0.011
$F = \text{high}$	0.004	0.011

$$P(D = 1) = \sum_f \sum_s P(D = 1, F = f, S = s)$$

What about 10 Random Variables?

Imagine you have **10 discrete** RVs which can each take on **5 values**

$$\# \text{ unique assignments} = 5^{10}$$

10 million entries in your joint table.

So, we are going to need models ...

... **probabilistic models** ...

Roll 100 dice.

X_1 = How many 1s?

X_2 = How many 2s?

X_3 = How many 3s?

X_4 = How many 4s?

X_5 = How many 5s?

X_6 = How many 6s?

How big is the joint table?

Sometimes the structure of the
variables suggests a more efficient
representation

Multinomial RV

Probability

Binomial RV

What is the probability of getting k successes and $n - k$ failures in n trials?

$$P(X = k) = \binom{n}{k} p^k (1 - p)^{n-k}$$

Binomial # of ways of ordering the successes

Probability of each ordering of k successes is equal + mutually exclusive

Multinomial RV

What is the probability of getting c_1 of outcome 1, c_2 of outcome 2, ..., and c_m of outcome m in n trials?

Multinomial RVs generalize Binomial RVs

Recall the Binomial Derivation: What if more than two outcomes?

(H, H, H, H, T, T, T, T, T, T)
(H, H, H, T, H, T, T, T, T, T)
(H, H, H, T, T, H, T, T, T, T)

(A, A, A, C, C, C, C, B, C, A)
(A, A, A, C, C, C, C, B, C, B)
(A, A, B, A, A, C, C, C, C, C)
(A, A, B, A, C, A, C, C, C, C)
(A, A, B, A, C, C, C, C, A, C)
(A, A, B, A, C, C, C, C, C, A)
(A, A, B, C, A, A, C, C, C, C)
(A, A, B, C, A, C, A, C, C, C)
(A, A, B, C, A, C, C, A, C, C)
(A, A, B, C, A, C, C, C, A, C)

$p_A = 0.6$
 $p_B = 0.1$
 $p_C = 0.3$

First here is a simulator where you can try rolling this dice 10 times:

Dice Roll Simulator

Number of rolls n:

Simulate

Simulator results:
C, C, B, A, A, A, C, C, C, A

Totals:
A: 4
B: 1
C: 5

What is the probability of exactly 4 As, 1 B and 5 Cs?

Multinomial Random Variable?

Consider an experiment of n independent trials:

- Each trial results in one of m outcomes. $P(\text{outcome } i) = p_i$, $\sum_{i=1}^m p_i = 1$
- Let $X_i = \#$ trials with outcome i

Joint PMF

$$P(X_1 = c_1, X_2 = c_2, \dots, X_m = c_m) =$$

where $\sum_{i=1}^m c_i = n$ and $\sum_{i=1}^m p_i = 1$

$$p_1^{c_1} p_2^{c_2} \cdots p_m^{c_m}$$

Probability of each ordering is equal + mutually exclusive

Multinomial Random Variable?

Consider an experiment of n independent trials:

- Each trial results in one of m outcomes. $P(\text{outcome } i) = p_i$, $\sum_{i=1}^m p_i = 1$
- Let $X_i = \#$ trials with outcome i

Joint PMF

$$P(X_1 = c_1, X_2 = c_2, \dots, X_m = c_m) = \binom{n}{c_1, c_2, \dots, c_m} p_1^{c_1} p_2^{c_2} \dots p_m^{c_m}$$

where $\sum_{i=1}^m c_i = n$ and $\sum_{i=1}^m p_i = 1$

Multinomial # of ways of ordering the outcomes

Probability of each ordering is equal + mutually exclusive

Sometimes the structure of the
variables suggests a more efficient
representation

I roll 6 dice. What is more probable:

A) I roll 6 “sixes”

B) I roll exactly one of each number

Hello dice rolls, my old friends

A 6-sided die is rolled 7 times.

What is the probability of getting:

- 1 one
- 0 threes
- 0 fives
- 1 two
- 2 fours
- 3 sixes

Hello dice rolls, my old friends

A 6-sided die is rolled 7 times.

What is the probability of getting:

- 1 one
- 0 threes
- 0 fives
- 1 two
- 2 fours
- 3 sixes

$$P(X_1 = 1, X_2 = 1, X_3 = 0, X_4 = 2, X_5 = 0, X_6 = 3)$$

$$= \binom{7}{1,1,0,2,0,3} \left(\frac{1}{6}\right)^1 \left(\frac{1}{6}\right)^1 \left(\frac{1}{6}\right)^0 \left(\frac{1}{6}\right)^2 \left(\frac{1}{6}\right)^0 \left(\frac{1}{6}\right)^3 = 420 \left(\frac{1}{6}\right)^7$$

Hello dice rolls, my old friends

A 6-sided die is rolled 7 times.

What is the probability of getting:

- 1 one
- 1 two
- 0 threes
- 2 fours
- 0 fives
- 3 sixes

of times
a six appears

$$P(X_1 = 1, X_2 = 1, X_3 = 0, X_4 = 2, X_5 = 0, X_6 = 3)$$

$$= \binom{7}{1,1,0,2,0,3} \left(\frac{1}{6}\right)^1 \left(\frac{1}{6}\right)^1 \left(\frac{1}{6}\right)^0 \left(\frac{1}{6}\right)^2 \left(\frac{1}{6}\right)^0 \left(\frac{1}{6}\right)^3 = 420 \left(\frac{1}{6}\right)^7$$

choose where the sixes appear

probability of rolling a six this many times

Parameters of a Multinomial RV?

$X \sim \text{Bin}(n, p)$ has parameters $n, p \dots$

$$P(X = k) = \binom{n}{k} p^k (1 - p)^{n-k}$$

p : probability of
success outcome
on a single trial

A Multinomial RV has parameters n, p_1, p_2, \dots, p_m (Note $p_m = 1 - \sum_{i=1}^{m-1} p_i$)

$$P(X_1 = c_1, X_2 = c_2, \dots, X_m = c_m) = \binom{n}{c_1, c_2, \dots, c_m} p_1^{c_1} p_2^{c_2} \cdots p_m^{c_m}$$

p_i : probability of outcome i on a single trial

Where do we get p_i from?

Most useful when probabilities are not equal

The screenshot shows a web browser window with the URL `cs109psets.netlify.app/fall24/lecture11/multinomial_dice`. The page is titled "Multinomial Dice" and is part of "Lecture 11 - Probabilistic Models". A sidebar on the left shows a list of questions, with question 2 selected. The main content area contains the following text:

You have a funny shaped dice.

The probability of getting a 1 is 0.2

The probability of getting a 2 is 0.3

The probability of getting a 3 is 0.1

The probability of getting a 4 is 0.1

The probability of getting a 5 is 0.1

The probability of getting a 6 is 0.2

You roll the dice 6 times. What is the probability of getting exactly:

two 2s

two 4s

two 6s

(consider the dice un-ordered)

Answer checker

A red arrow points from the probability of getting a 6 (0.2) down to the question text.

The right sidebar contains an "Answer Editor" and a "Solution" section. The "Answer Editor" has a "Numeric Answer:" field with the placeholder "Enter your answer" and a "Check Answer" button. The "Solution" section has an "Explanation:" field with a dropdown menu showing "Block LaTeX", "Inline LaTeX", "Python", and "Image".

The Federalist Papers

Intro to Natural Language Processing

Probabilistic text analysis

Ignoring the order of words...

What is the probability of any given word that you write in English?

- $P(\text{word} = \text{"the"}) > P(\text{word} = \text{"pokemon"})$
- $P(\text{word} = \text{"Stanford"}) > P(\text{word} = \text{"Cal"})$

Probabilities of *counts* of words = Multinomial distribution

A document is a large multinomial.

(according to the Global Language Monitor, there are 988,968 words in the English language used on the internet.)

Model text as a multinomial

Example document:

“Pay for Viagra with a credit-card. Viagra is great. So are credit-cards. Risk free Viagra. Click for free.”

$n = 18$

$$P \left(\begin{array}{l} \text{Viagra} = 3 \\ \text{Free} = 2 \\ \text{Risk} = 1 \\ \text{Credit-card: } 2 \\ \dots \\ \text{For} = 2 \end{array} \middle| \text{spam} \right)$$

Probability of seeing this
document | spam

It's a Multinomial!

$$\frac{n!}{3! 2! \dots 2!} p_{\text{viagra}}^3 p_{\text{free}}^2 \dots p_{\text{for}}^2$$

The probability of a word in spam
email being viagra

Who wrote the federalist papers?

Old and New Analysis

Authorship of the Federalist Papers

- 85 essays advocating ratification of the US constitution
- Written under the pseudonym “Publius” (really, Alexander **Hamilton**, James **Madison**, John **Jay**)

Who wrote which essays?

- Analyze probability of words in each essay and compare against word distributions from known writings of three authors

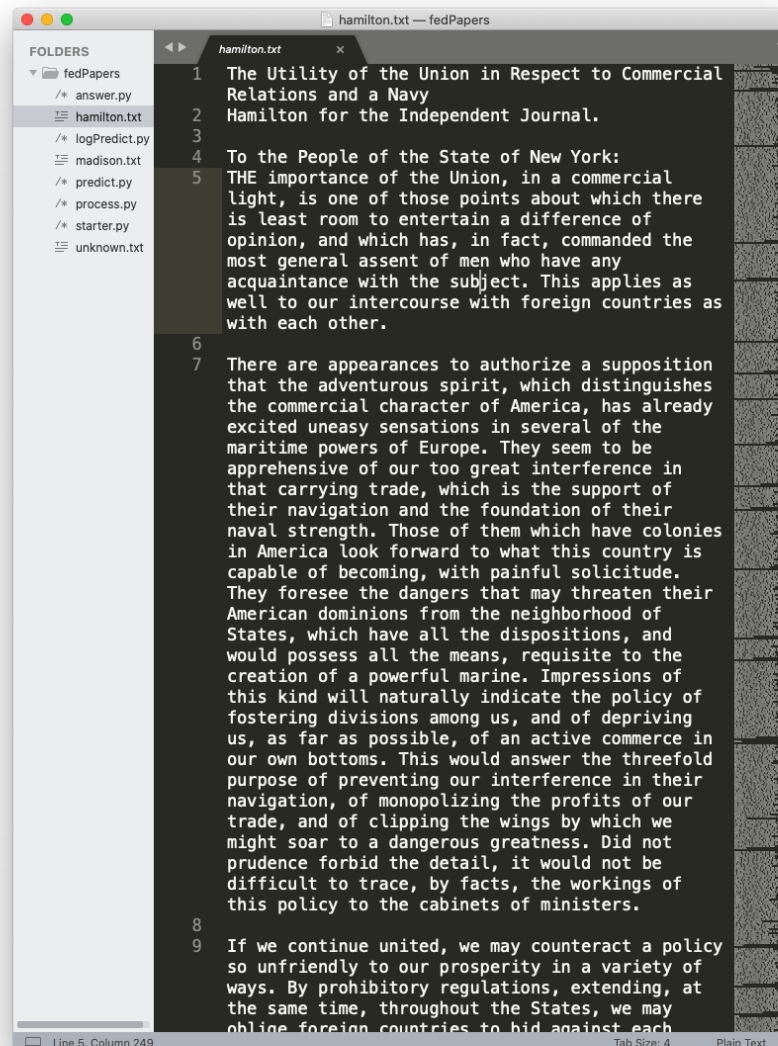

Who wrote Federalist Paper 53?

  to our case. The important distinction so well
```

Where to start?

We have words, we want to know probability of authorship. We also know probability of words given author...

Well hello again...

Who wrote Federalist Paper 53?

Diagram illustrating the formula for calculating the probability of Hamilton given the document, $P(H|D)$, using Bayes' theorem:

$$P(H|D) = \frac{P(D|H)P(H)}{P(D)}$$

The components of the formula are labeled with blue arrows:

- $P(H|D)$: Prob Hamilton given Document
- $P(D|H)$: Prob Document given Hamilton
- $P(H)$: Prior belief it was Hamilton
- $P(D)$: Prob of the document???

Who wrote Federalist Paper 53?

Model document as a
multinomial where we care
about count of words

$$P(H|D) = \frac{P(D|H)P(H)}{P(D)}$$

Who wrote Federalist Paper 53?

Diagram illustrating the formula for calculating the probability of Hamilton writing a document given the document's word counts:

$$P(H|D) = \frac{\binom{n}{c_1 \dots c_k} \cdot \prod_i h_i^{c_i} \cdot P(H)}{P(D)}$$

Annotations:

- $P(H|D)$: Prob Hamilton given Document
- $\binom{n}{c_1 \dots c_k}$: Number of times word i is in the doc
- $\prod_i h_i^{c_i}$: Loop over unique words; Prob hamilton would write word i
- $P(H)$: Prior belief it was Hamilton
- $P(D)$: Prob of the document???

Who wrote Federalist Paper 53?

Prob that Hamilton wrote it

$$\begin{aligned} P(H|D) &= \frac{P(D|H)P(H)}{P(D)} \\ &= \frac{P(H) \cdot \binom{n}{c_1 \dots c_m} \cdot \prod_i h_i^{c_i}}{P(D)} \end{aligned}$$

Prob that Madison wrote it

$$\begin{aligned} P(M|D) &= \frac{P(D|M)P(M)}{P(D)} \\ &= \frac{P(M) \cdot \binom{n}{c_1 \dots c_m} \cdot \prod_i m_i^{c_i}}{P(D)} \end{aligned}$$

$$\begin{aligned} \frac{P(H|D)}{P(M|D)} &= \frac{P(H) \cdot \binom{n}{c_1 \dots c_k} \cdot \prod_i h_i^{c_i}}{P(D)} / \frac{P(M) \cdot \binom{n}{c_1 \dots c_k} \cdot \prod_i m_i^{c_i}}{P(D)} \\ &= \frac{\prod_i m_i^{c_i}}{\prod_i h_i^{c_i}} \end{aligned}$$

To the code

What happened?

All our probabilities are zero...

Log Review

$$e^y = x$$

$$\log(x) = y$$

Graph for $\log(x)$

[More info](#)

Log Identities

$$\log(a \cdot b) = \log(a) + \log(b)$$

$$\log(a/b) = \log(a) - \log(b)$$

$$\log(a^n) = n \cdot \log(a)$$

Products become sums!

$$\log(a \cdot b) = \log(a) + \log(b)$$

$$\log\left(\prod_i a_i\right) = \sum_i \log(a_i)$$

* Spoiler alert: This is important because the product of many small numbers gets hard for computers to represent.

Use logs when probabilities become too small!

The doc

Number of times word i shows up in the doc

Hamilton wrote it

Maddison wrote it

$$\frac{P(H|D)}{P(M|D)} = \frac{\prod_i h_i^{c_i}}{\prod_i m_i^{c_i}}$$

h_i = Prob Hamilton writes word i

m_i = Prob Maddison writes word i

$$\begin{aligned}\log \frac{P(H|D)}{P(M|D)} &= \log \frac{\prod_i h_i^{c_i}}{\prod_i m_i^{c_i}} \\&= \sum_i \log h_i^{c_i} - \sum_i \log m_i^{c_i} \\&= \sum_i c_i \cdot \log h_i - \sum_i c_i \log m_i\end{aligned}$$

What does it mean if a log value is positive / negative

Graph for $\log(x)$

If a log is negative, its input was between 0 and 1

[More info](#)

Use logs when probabilities become too small!

$$\begin{aligned}\log \frac{P(H|D)}{P(M|D)} &= \log \frac{\prod_i h_i^{c_i}}{\prod_i m_i^{c_i}} \\&= \sum_i \log h_i^{c_i} - \sum_i \log m_i^{c_i} \\&= \sum_i c_i \cdot \log h_i - \sum_i c_i \log m_i \\&= -1344\end{aligned}$$

Hamilton Term	-12925
Madison Term	-11581

$$\frac{P(H|D)}{P(M|D)} < 1$$

Madison wrote it!

Great Question
(Bonus if we have time)

How does python sample from a
Gaussian?

```
from random import *
```

```
for i in range(10):
```

```
    mean = 5
```

```
    std = 1
```

```
    sample = gauss(mean, std)
```

```
    print sample
```

How does
this work?

3.79317794179

5.19104589315

4.209360629

5.39633891584

7.10044176511

6.72655475942

5.51485158841

4.94570606131

6.14724644482

4.73774184354

How Does a Computer Sample a Normal?

How Does a Computer Sample a Normal?

Sample 1:
1.201234

Sample 2:
-0.45123

$$\Phi(x) = y$$
$$x = \Phi^{-1}(y)$$
